1. Introduction

The Local Service Directory for Bahawalpur is a web-based platform designed to help people find local service providers in Bahawalpur easily and quickly. People often face difficulties finding reliable electricians, plumbers, mechanics, carpenters, tutors, cleaners, beauticians, and other service providers. They usually depend on personal references, social media groups, or scattered online information. This project aims to solve this problem by providing a single platform where users can search for local services and access relevant contact information.

2. Problem Statement

Currently, information about local service providers is not always available in one organized place. Finding a suitable service provider can take time, especially when people need a particular service in a specific area of Bahawalpur. Users may also struggle to compare different providers or find updated contact details. Similarly, local workers and small businesses may find it difficult to promote their services online. Therefore, a centralized online directory can make the process easier for both customers and service providers.

3. Project Objectives

The main objective of this project is to develop a user-friendly website that connects people with local service providers in Bahawalpur. The system will organize service information into different categories so users can find relevant providers without searching through multiple platforms.

The specific objectives are to provide categorized service listings, enable keyword-based searching, display service provider details, support area-based filtering, and allow administrators to manage directory information. Another objective is to help local workers and small businesses improve their online visibility.

4. Main Features

The website will include a homepage that introduces the platform and displays popular service categories. Users will be able to browse categories such as home repair, electrical services, plumbing, vehicle repair, education and tutoring, beauty services, cleaning, and computer repair.

A search feature will allow users to search for a service by name or keyword. Area-based filtering will help users find providers in relevant localities of Bahawalpur. Each service listing will display available information such as the provider's name, service category, area, contact number, description, and optional working hours.

The system will include a service provider submission form through which providers can request to add their services. Submitted listings can be reviewed by the administrator before publication. An admin dashboard will allow the administrator to add, edit, approve, reject, or remove service listings and manage service categories.

The website will also provide a responsive design so that users can access it through mobile phones, tablets, and computers. Basic validation will be applied to forms to improve data accuracy and usability.

5. Tools and Technologies

Backend: Python with the Django framework will handle backend operations, including form processing, user requests, and the admin dashboard. SQLite will be used as the database to store service provider details, service categories, and administrator information.

Frontend: HTML will be used to create the structure of the website, while Bootstrap 5 will be used to design a clean and responsive interface. JavaScript will provide interactive features such as search and filtering.

Hosting: The website will be deployed and hosted on PythonAnywhere.

6. Scope of the Project

The initial version will focus on service providers operating in Bahawalpur. It will include service categories, searchable listings, locality-based filtering, provider contact details, listing submissions, and administrative management. The project will not require a complex payment system or advanced artificial intelligence features. Future improvements may include user reviews, ratings, provider accounts, map integration, and WhatsApp contact links.

7. Expected Outcomes

The expected outcome is a functional web-based directory that makes local services easier to discover. Customers will be able to find relevant service providers more conveniently, while local workers and small businesses will have an additional way to display their services. The administrator will be able to maintain organized and updated listings through the admin dashboard.

8. Conclusion

The Local Service Directory for Bahawalpur is a practical and useful project that addresses a real everyday problem faced by the people of the city. By bringing local service providers together on a single platform, it saves time for customers and gives local workers and small businesses a simple way to be seen online. With a clean interface, searchable listings, area-based filtering, and an admin dashboard for managing content, the system will be easy to use and easy to maintain. The project can also be extended in the future with features such as reviews, ratings, and WhatsApp contact links, making it a strong foundation for a complete local services platform.
